

Team F: Flight Search Component

Assignment #5 - Fallback Slides (Standalone Team F Demo)

Team F

April 2026

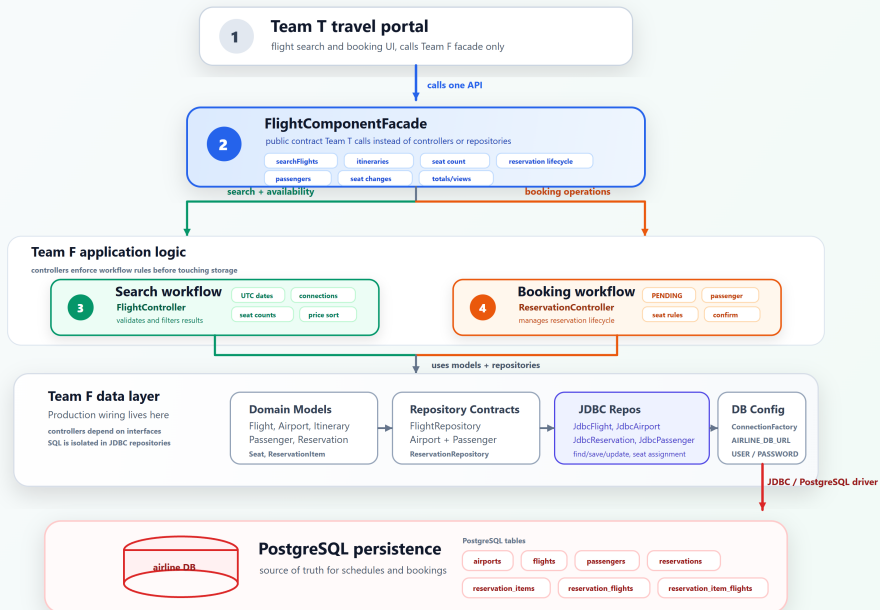

- Flight search for Icelandic airports.
- Availability-based booking with seat assignment.
- JDBC + PostgreSQL persistence layer.
- Integration-ready API exposed via `FlightComponentFacade`.

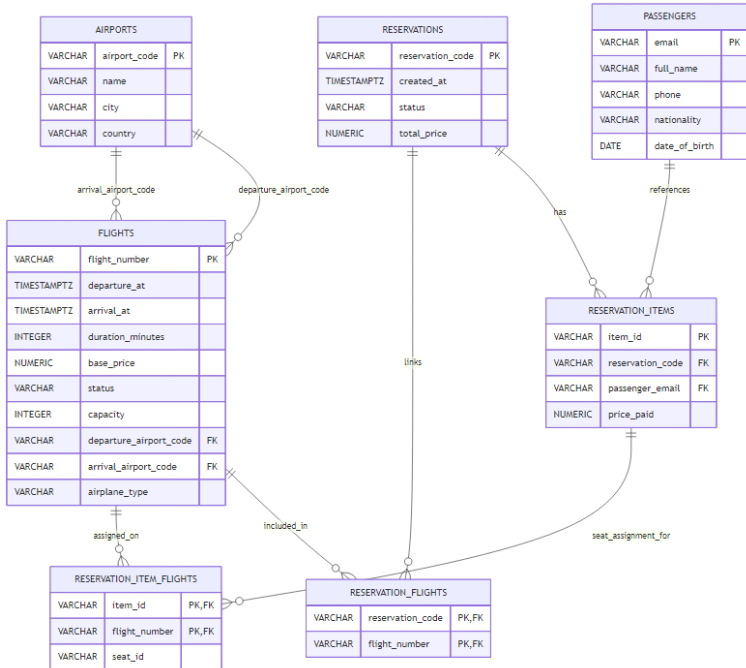

Demo scenario

- ① Search flights with passenger count set to 3.
- ② Select a matching flight and book 2 seats.
- ③ Run the same search again with passenger count 3.
- ④ Flight disappears from results if remaining seats are below requested count.

What this proves

- Booking reduces availability in persistent storage.
- Search results reflect live availability constraints.

Team F Retrospective

What worked

- Internal Team F collaboration was mostly solid.
- Backend responsibilities became clear early.
- Facade contract gave a stable integration surface.

Challenges

- Some weeks had low responsiveness, which slowed decisions.
- Cluster-level communication with Team T was weaker than needed for smooth integration.
- We often had to initiate follow-up and alignment.

Lessons learned

- Define fixed cross-team check-ins early.
- Assign a clear integration owner per team.
- Lock integration milestones earlier in the semester.
